Mini Project: Bringing Your UI to Life – Interaction Design, Components & Micro-Interactions

Name: Nanle Joseph
Track: UI/UX Design
Project Title: AI Travel Planner – Components, Variants & Interactions

Objective

This project focuses on turning my static UI designs into interactive and responsive experiences by creating reusable components and defining micro-interactions in Figma.

I used Figma's Components and Variants features to build consistent design elements that adapt across all screens in the Travel Planner App.

Step 1: Components and Variants Created

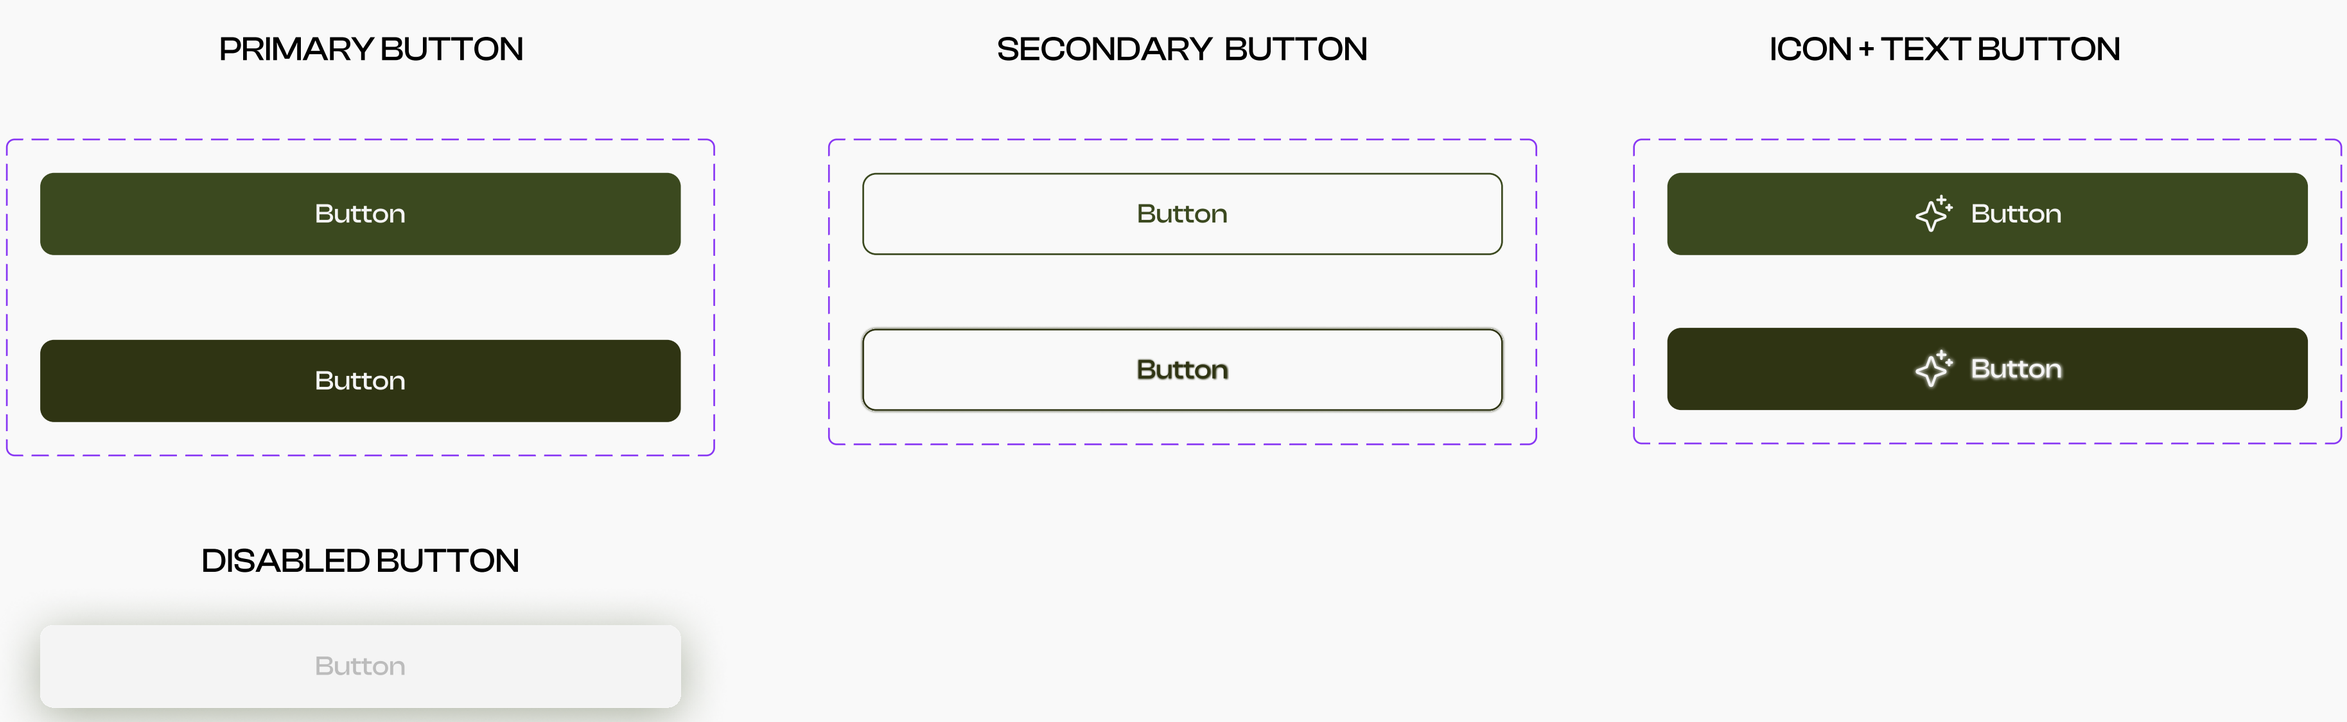

I designed the following components, each with appropriate states and variants to support interaction and user feedback:

1. Buttons

Component: Button
Variants:

- Primary (Default, Pressed, Disabled)
- Secondary (Default, Pressed)
- Icon + Text Button

Micro-interaction: Button color changes on press

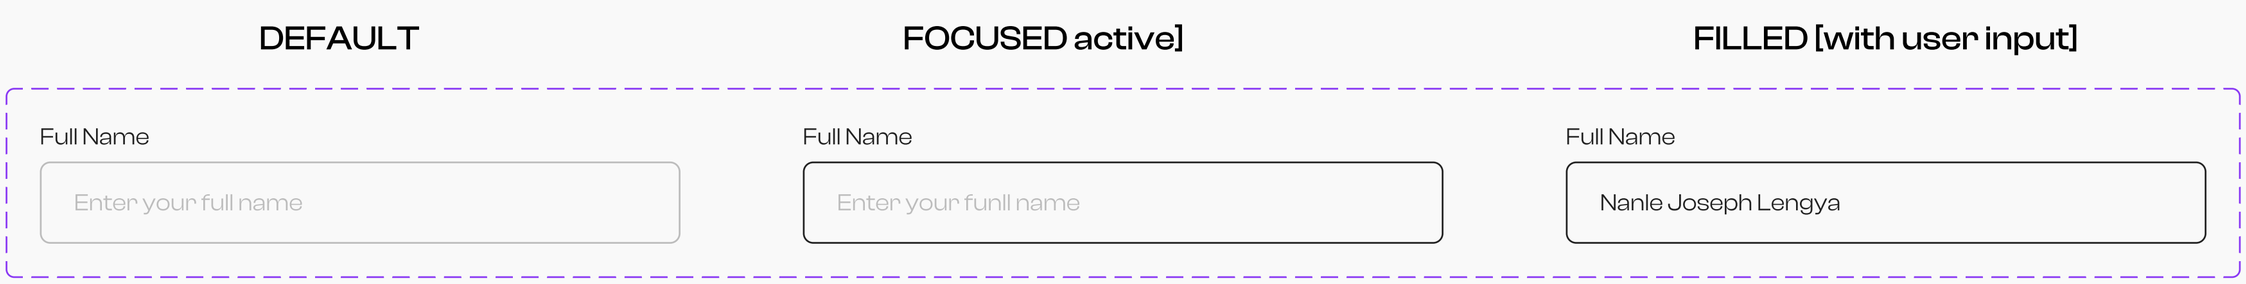

2. Input Fields

Component: Text Input
Variants:

- Default (with placeholder)
- Focused (active)
- Filled (with user input)
- Error State (with red border + message)

Micro-interaction: Border color changes on focus; error message fades in when invalid input is detected

Enter your email

Email Address is correct

3. Cards

Component: Destination Card / Itinerary Card

Micro-interaction: Cards animate on hover; content expands or collapses smoothly

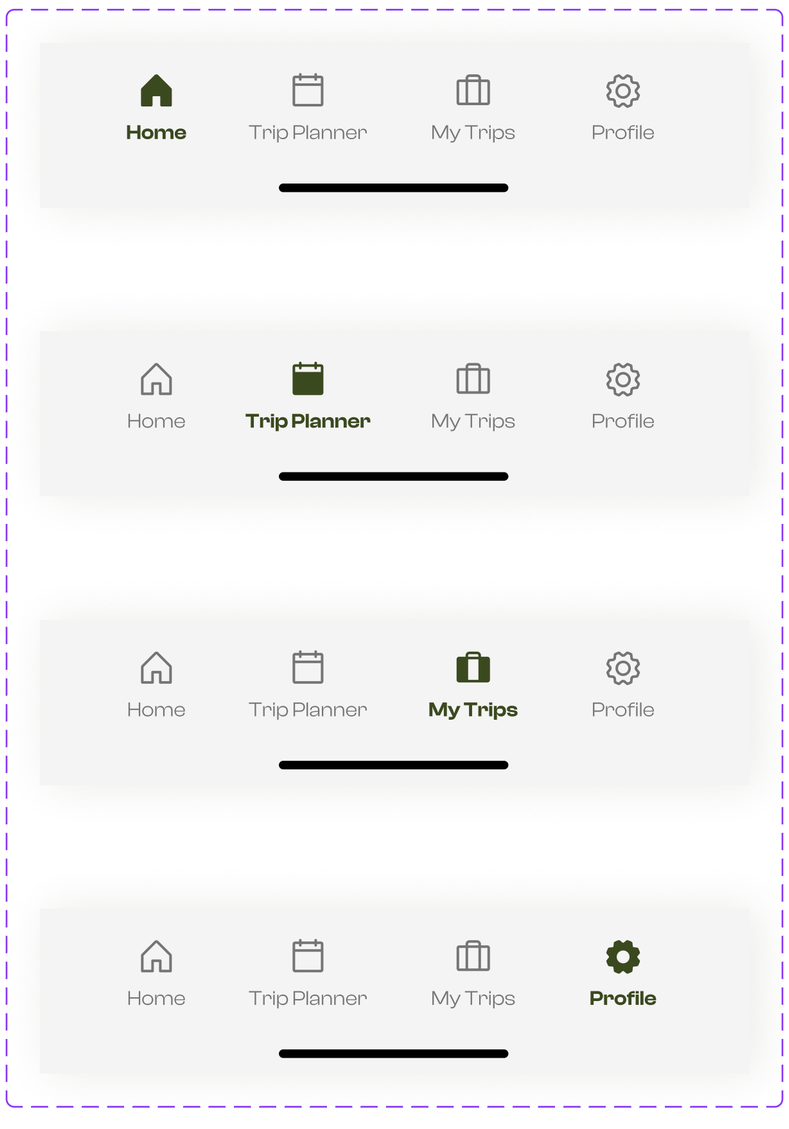

4. Bottom Navigation Bar

Component: Bottom Nav
Variants:

- Home (active/inactive)
- Trip Planner (active/inactive)
- My Trips (active/inactive)
- Profile (active/inactive)

Micro-interaction: Tab icon fills and label bolds on selection

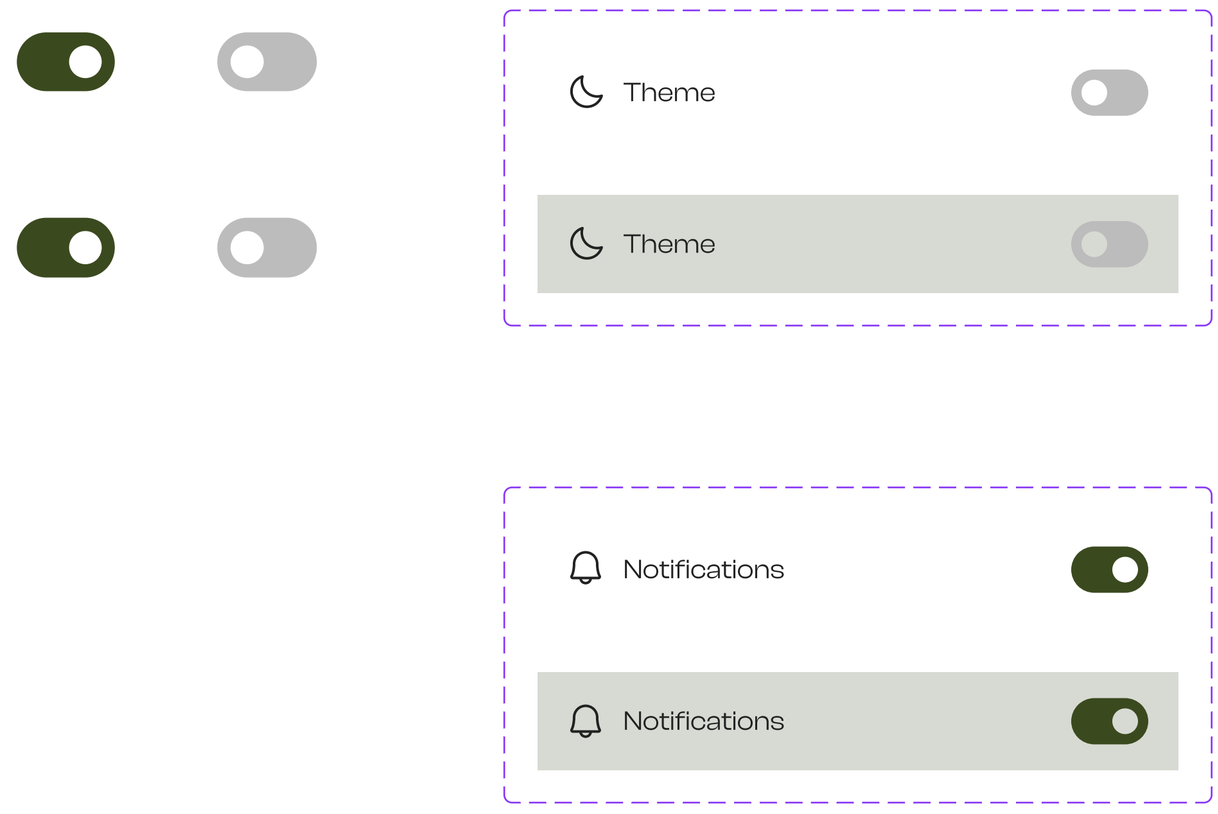

5. Toggle Switch

Component: Settings Toggle
Variants:

- On
- Off

Micro-interaction: Toggle smoothly slides with color transition when tapped

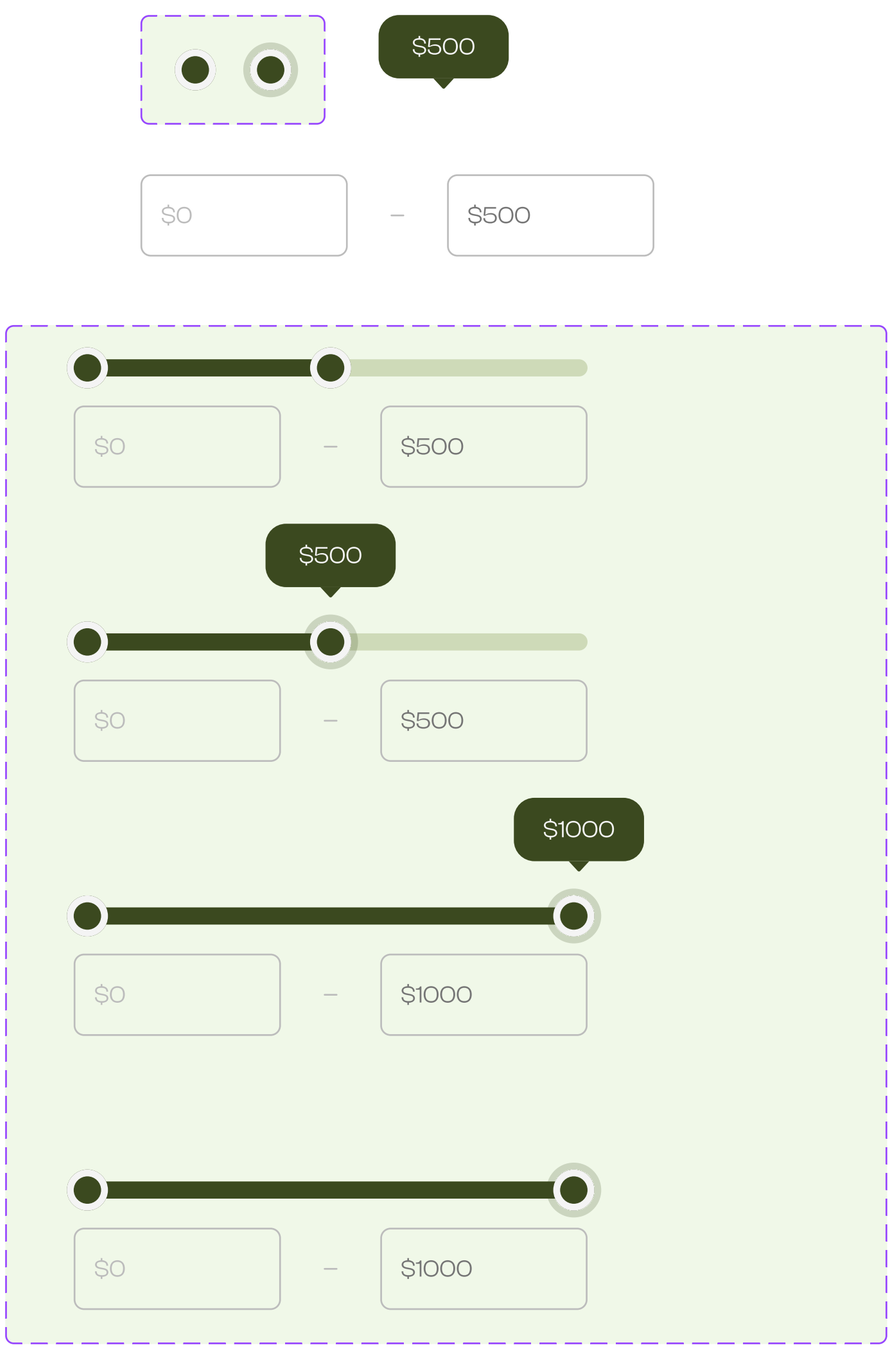

6. Range Slider

Component: Budget Range Slider
Variants:

- Default
- Dragging
- Filled (with values selected)

Micro-interaction: Smooth transition as the slider is dragged, with real-time feedback displayed in a bubble or label

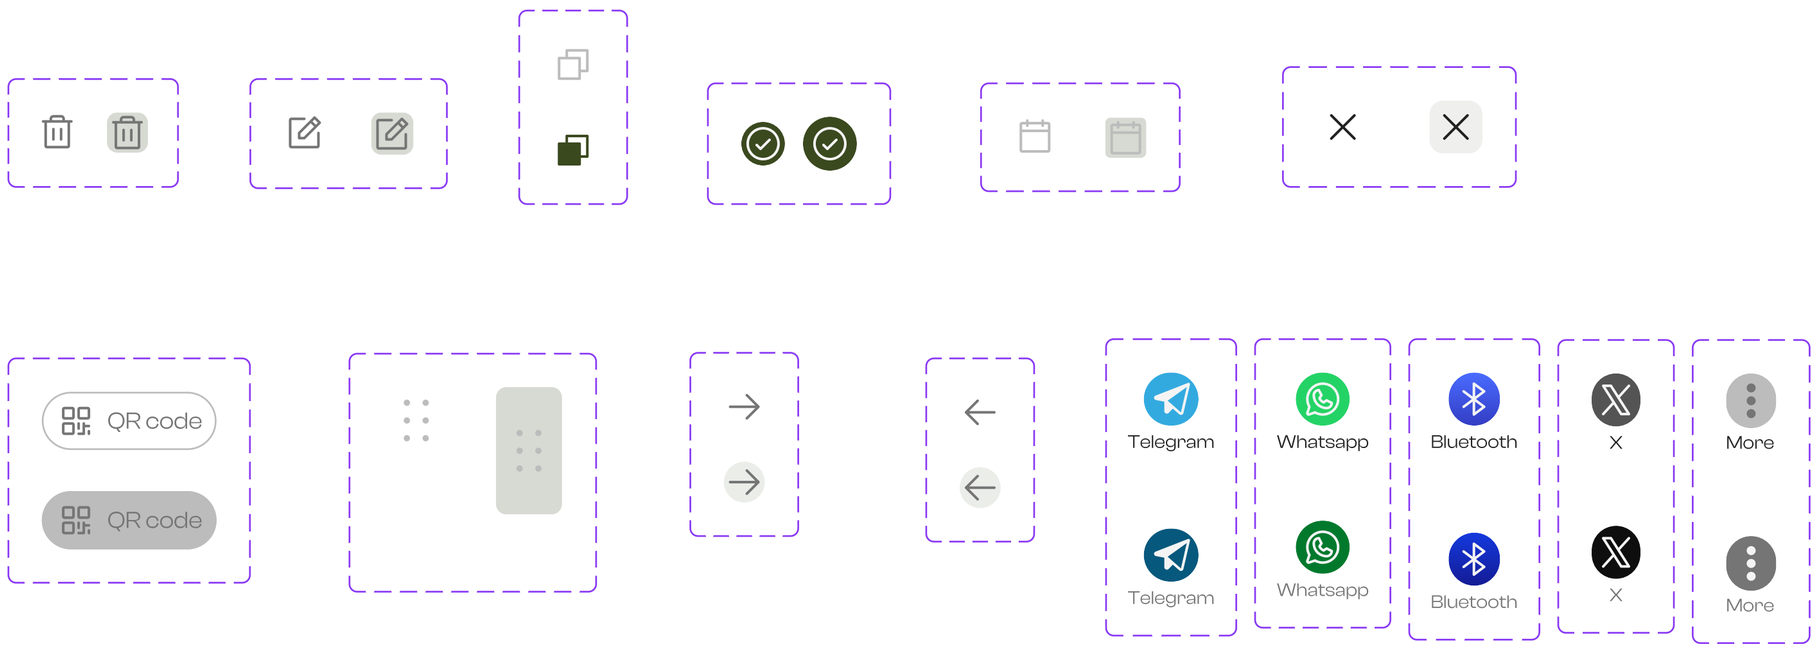

7. Icons (Reusable Components)

Component: Icon Set
Variants:

- Active / Inactive states
- Filled / Outlined styles
- Color-coded versions for accessibility

Micro-interaction: Selection triggers scale or color change for feedback

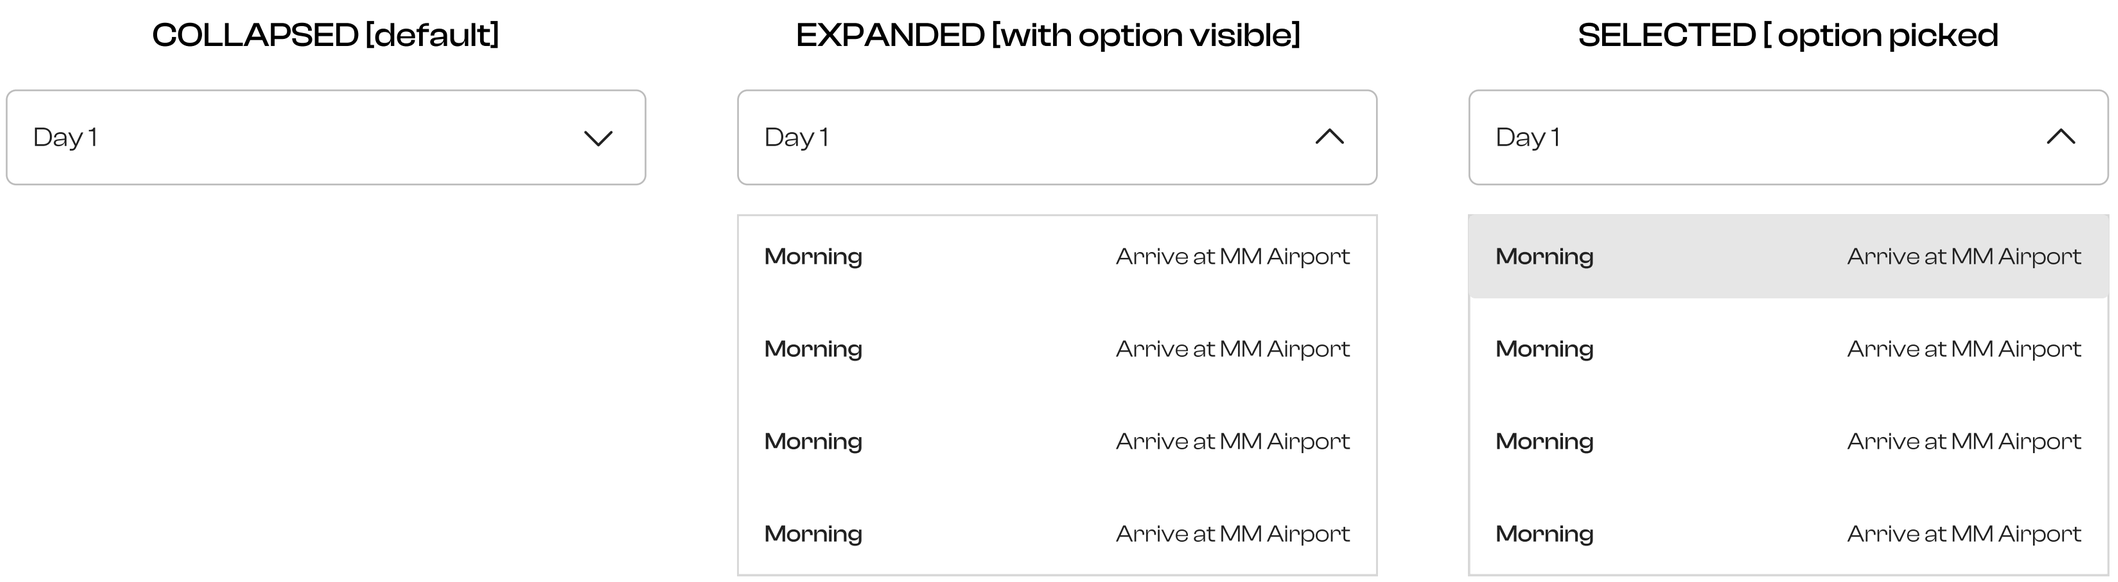

8. Dropdown Menu

Component: Dropdown Field
Variants:

- Collapsed (default)
- Expanded (with options visible)
- Selected (option picked)

Micro-interaction: Dropdown expands with animation and fades in options

Reusable Patterns and Best Practices

- Used Auto Layout and a consistent 8pt spacing system to ensure alignment and scalability
- Leveraged Variants to minimize duplication and ensure state flexibility
- Created Interactive Components to simulate real-time feedback and make prototyping more realistic
- Organized all components under a clear naming system for easier development handoff

💡 **How It Brings the UI to Life**

- Enhances user experience by providing visual feedback for every interaction
- Maintains design consistency and reduces rework
- Supports accessibility and responsiveness
- Speeds up prototyping and testing for real-time experiences
