1. User Flow (For Planning a Trip)

2. User Journey Map (Anabel Jones – Mobile Use Case)

Stage	Discovery	Onboarding	Trip Planning	Customization	Sharing & Saving	Post-Trip Engagement
User Actions	Sees a sponsored post or influencer reel about the app on Instagram	Installs app → signs up with Google → sets preferences	Inputs destination, dates, budget, and travel interests	Edits itinerary to adjust activities, timing, and accommodation	Saves the final itinerary, shares on WhatsApp and Instagram	Gets reminders, leaves feedback, and views trip summary
Thoughts	"This app looks different from regular travel apps"	"Hope I won't have to fill out too much info"	"This AI thing better get me"	"Some things don't really match my vibe"	"Wow, this looks professional"	"Next time, I'll plan even earlier"
Emotions	Curious, Intrigued	Cautiously optimistic	Impressed, Hopeful	Slightly stressed but in control	Proud, Confident	Reflective, Grateful
Pain Points	Not sure if it's truly different from others	Multiple preference fields feel tiring	Some activities suggested aren't relevant or feel generic	No quick preview when editing itinerary	No save-to-gallery or PDF export	No reward system or follow-up incentive
Opportunities	Show user-generated content and testimonials	Enable "Skip & set up later" option in onboarding	Highlight why AI suggestions are made (e.g. "Based on your interests...")	Allow users to toggle between different itinerary styles (chill, adventure, foodie)	Include "Download as PDF" and "Create Reel" options	Offer post-trip rating and points for referrals

3. INFORMATION ARCHITECTURE (IA for Mobile App)
