Wireframe for AI-powered Travel Planner

Wireframe Usability & Efficiency Summary

The wireframe design for the AI-Powered Travel Planner was crafted to prioritize usability and task efficiency at every step of the user journey. Each screen is structured around a single core action — whether it's planning a trip, customizing an itinerary, or reviewing travel details — to reduce cognitive load and guide users naturally through the process.

Input forms follow a logical, real-world sequence (destination → dates → budget → interests), minimizing confusion and streamlining data collection. Key actions like "Plan Your Trip" and "Generate Itinerary" are prominently placed and easy to access, especially on mobile devices.

The use of collapsible day cards in the itinerary view allows users to digest plans in chunks, while the customization screen supports drag-and-drop reordering and quick swaps — balancing AI automation with human control. Save and share features are positioned at decision points, enabling smooth transitions from planning to action.

By applying mobile-first layout practices, clean visual hierarchy, and thumb-friendly interaction zones, the wireframe ensures users can complete key tasks quickly, confidently, and with minimal effort.

Core Design Philosophy

- Mobile-first: All layouts are optimized for 430×932 mobile screens.
- User-centered: Decisions are based on the journey and mental models of a real traveler.
- AI as assistive, not dominant: While AI powers the backend, the user always stays in control.
- Clarity & simplicity: Every screen serves one purpose. Nothing extra. Nothing confusing.
- Fast, thumb-friendly interactions: Important buttons are placed where thumbs naturally rest.

Mentor Feedback Note

"Your overall structure is solid — especially how each screen is focused on a specific action. I like how you've kept the layout mobile-first and task-oriented. However, a few things stood out during my walkthrough:

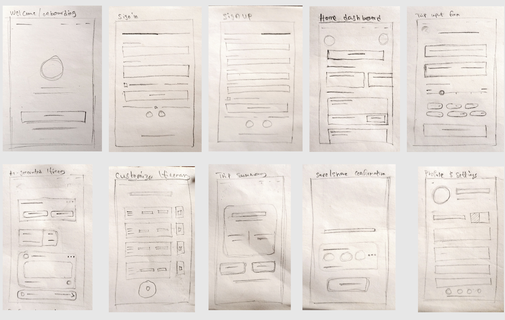

On the Trip Input Form screen, while the order of the inputs makes sense, I had to scroll quite a bit before seeing the 'Generate Itinerary' button. Consider making it sticky, especially for mobile users — it's the primary call to action and should be always visible.

Also, I noticed the Home Dashboard shows both 'Featured Destinations' and 'My Trips'. While this works, a clearer visual hierarchy would help — maybe larger trip cards or section headers with more padding to break up the content visually."

Action Steps Taken:

- Made the 'Generate Itinerary' button sticky at the bottom of the Trip Input screen for faster access on mobile.
- Added more spacing and clearer headers to distinguish between Featured Destinations and My Trips on the Home Dashboard, improving content scannability.

Rough hand-drawn sketches

Thought Process by Screen;

1. Welcome / Onboarding

Goal: Quickly introduce the app without overwhelming the user.

- Minimal content: Keeps user focused.
- Centered logo and CTA: Prominent and immediate access.
- Subtle prompt to log in: Allows experienced users to skip intro.

2. Sign In / Sign Up

Goal: Enable fast and flexible account access.

- Tabs for login/signup: Familiar pattern for users.
- Social logins: Reduce friction, especially for mobile users.
- Vertical stacking: Natural scroll direction. Supports quick input on the go.

3. Home Dashboard

Goal: Serve as a command center for planning or continuing a trip.

- "Plan Your Trip" CTA at top: Highlights the app's core function.
- Featured Destinations (horizontal scroll): Encourages discovery with minimum space.
- "My Trips": Personalizes the app and encourages re-engagement.

4. Trip Input Form

Goal: Gather all necessary inputs to generate a personalized plan.

- Field order follows user thought process: First where → when → how much → what kind.
- Slider for budget: Quick and visual compared to typing amounts.
- Interest chips: Tappable UI elements are more engaging than dropdowns.

5. AI-Generated Itinerary

Goal: Present results in a digestible and engaging format.

- Daily breakdowns: Aligns with how people mentally organize trips.
- Cards for each day: Visually scannable and compact.
- Map thumbnails: Provide spatial context without overloading with full maps.

6. Customize Itinerary

Goal: Allow personal control over the plan.

- Drag-and-drop activities: Gives users tangible control over their day.
- Quick swap buttons: Easily replace suggestions with alternatives.
- Floating Add button: Encourages creativity and personalization.

7. Trip Summary

Goal: Confirm and finalize the plan.

- Summary card: Provides snapshot clarity on budget, duration, and destination.
- Dual CTA (Save / Share): Matches user intent after planning.
- Optional PDF export: Useful for travelers who want offline or printed copies.

8. Save/Share Confirmation

Goal: Celebrate task completion and encourage sharing.

- Success message: Positive reinforcement.
- WhatsApp + Copy: Local relevance and practical options.
- Return to Home: Keeps users in flow.

9. Profile & Settings

Goal: Offer personalization and control.

- Grouped list layout: Easy for scanning and tapping.
- Dark/Light mode toggle: Aligns with modern expectations and accessibility.
- Logout at bottom: Prevents accidental taps, a common mobile UX best practice.
